

Kristopher Reed

FULL-STACK ENGINEER • GAME SYSTEMS & AI AUTOMATION

Florence, SD (Remote) | (605) 838-1341 | krisreed2001@gmail.com

github.com/Tkiljoy | linkedin.com/in/kris-reed-080574206 | portfolio-lac-three-81.vercel.app

Full-stack engineer who ships production systems end to end — from server-authoritative game backends and real-time multiplayer sync to Next.js web platforms and LLM agent pipelines. Six years building and shipping commercial software used by thousands of paying users. Comfortable owning a system from data model to UI, translating ambiguous requirements into shipped product, and delivering against real stakeholder deadlines.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Lua, Python, SQL, C#, Java

Frontend: React, Next.js, Astro, responsive UI architecture, HTML/CSS, Figma

Backend & Infra: Node.js, Fastify, FastAPI, PostgreSQL, MySQL, SQLite, Drizzle ORM, REST & HMAC-signed APIs, Electron, client-server architecture

AI & Automation: Claude & OpenAI APIs, LLM agent pipelines, multi-agent orchestration, MCP (Model Context Protocol), n8n

Practices: Real-time state sync, server-authoritative architecture, caching & invalidation strategies, Git/GitHub, solo end-to-end delivery

EXPERIENCE

Founder & Lead Engineer — Dragon Heart Studios

2022 – Present

- Architected and shipped DHS-BankingSim, a complete in-game banking economy — ~47,000 lines across 49 modules with a React-based UI layer. Built a 300–850 credit-scoring engine driving six loan products, a server-side fraud-detection engine, and a server-authoritative cache (TTL + dirty-flag invalidation) tuned for 200+ concurrent users.
- Designed a custom abstraction layer to ship a single codebase across three incompatible third-party platform APIs, eliminating per-platform forks and cutting maintenance to one source of truth.
- Built and shipped 30+ commercial products end to end — server logic, database persistence, real-time client-server sync, and responsive UIs — running live in production today.
- Grew the studio to \$30k+ annual revenue and 1,000+ paying customers, supporting a 2,000+ member user community across pricing, support, and marketplace compliance.

Lead Engineer — District 77

2023 – Present

- Built a production control-plane web platform for a live multiplayer service (1,000+ users) on Next.js 15 / React 19 / PostgreSQL / Drizzle — ~33k lines, 32 pages, 20 backend endpoints — with Discord-OAuth onboarding, a priority/reserved-slot queue, and a configurable applications pipeline.
- Built an economy console: 350+ typed configuration parameters pushing live config to the game server over HMAC-signed APIs, plus a what-if economy simulator and an anomaly-detection system that flags exploit and farming behavior automatically.
- Own server architecture, gameplay systems, and continuous feature delivery for the live platform.

Co-Founder & AI Engineer — ReeMain

2026 – Present

- Co-founded an AI automation studio (50/50, UK Ltd); built the platform and shipped 72+ production workflows on an n8n + LLM stack for email triage, lead qualification, and invoice automation.
- Integrated Claude and OpenAI reasoning over MCP tooling; designed the modular architecture underpinning the studio's services-to-SaaS transition.

Freelance Engineer — Self-Employed

2020 – Present

- Delivered 50+ commissioned systems to spec for content creators with 5,000,000+ subscriber audiences — owned brief-to-delivery, building a repeat client base on quality and reliable turnaround.

SELECTED PROJECTS

DHS-Lair — Multi-Agent AI Orchestration Platform *Node.js • TypeScript • Fastify • SQLite • Claude*

Self-hosted platform coordinating role-based AI agents (a router delegating to specialist agents), each sandboxed with its own tool allowlist. Shared persistent memory (SQLite + full-text search), an append-only audit log, kill switches, and an outbound exfiltration guard. Built entirely self-directed.

DHS-Minigames — Reusable UI Component Library *React • Lua • exports API*

119-game minigame library with a public exports API and a theming engine — drop-in skill-check and arcade components consumable by any downstream project.

EDUCATION

High School Diploma — Madison Central High School, Madison, SD • 2019

Self-taught engineer — a decade of shipping production software for real users under commercial pressure.
